Computers store and manipulate data.

Networks transfer data.

**Computers store and manipulate data.**

Networks transfer data.

# Data

Data can be anything

- Text
- Images
- Videos

All data can be represented one-dimensionally with 1s and 0s (bits)

How do you interpret a sequence of bits?

- Character encodings

# Data

## PPM example (a simple image file format)

```

# Storing Data

## Memory

- Voltage through a circuit indicates 1 or 0
- So with enough circuits we can represent arbitrary data
- Power loss = data loss

# Storing Data

## Hard Drive (Disk)

- Metal can be precisely magnetized/demagnetized
- Direction of magnetism indicates 1 or 0
- Platters can store data
- Does not need to maintain power

# Manipulating Data

## CPU

- Cleverly arranged circuits can model math
- Take some input state and deterministically produce some meaningful output state
- Defined instructions (code?!) allow us to tell the CPU what to do

# Operating System

Software that manages a computer's hardware and runs programs

Intermediary layer between user and hardware, and applications and hardware

## Kernel

- The most important part of an OS
- A program that controls the hardware
  - CPU, Memory, Devices

# Applications

Built on top of the operating system API

Written in high level programming languages (typically)

Examples: Microsoft Office, Web Browsers, Compilers, Database Management Systems

# Databases

Data stored on disk in a specific structured manner (think file formats)

A Database Management System (DBMS) sits on top of the database and allows other applications to interact with the data

# A Primitive Database

```
db_set () {  
    echo "$1,$2" >> database  
}  
  
db_get () {  
    grep "^$1," database | sed -e "s/^$1,/" | tail -n 1  
}
```

*Source: Martin Kleppmann, Designing Data-Intensive Applications*

# A Primitive Database

```
db_set () {  
    echo "$1,$2" >> database  
}  
  
db_get () {  
    grep "^$1," database | sed -e "s/^$1,/" | tail -n 1  
}
```

```
$ db_set 123 raymondxu.io
```

```
$ db_set 456 pokerchips.io
```

```
$ db_get 123  
raymondxu.io
```

```
$ cat database  
123,raymondxu.io  
456,pokerchips.io
```

*Source: Martin Kleppmann, Designing Data-Intensive Applications*

# Databases

Real databases use data structures and algorithms for efficiency

Data modeling is representing the data requirements of an application in a useful and efficient manner

# Layering

# Layering

Building Blocks: Transistors

# Layering

Storing Data: Memory, Disk

Building Blocks: Transistors

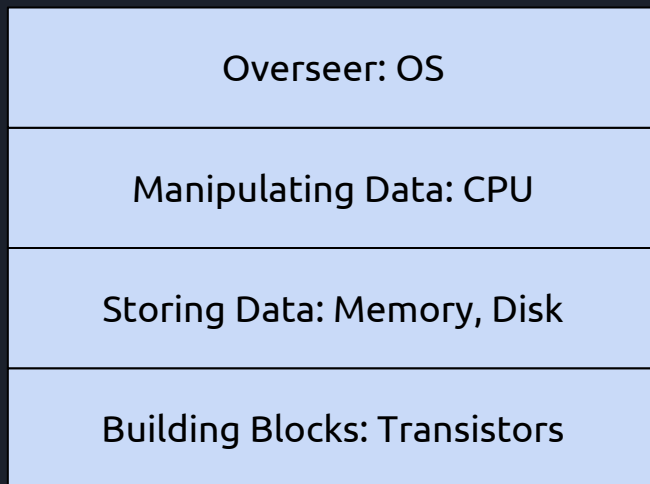

# Layering

Manipulating Data: CPU

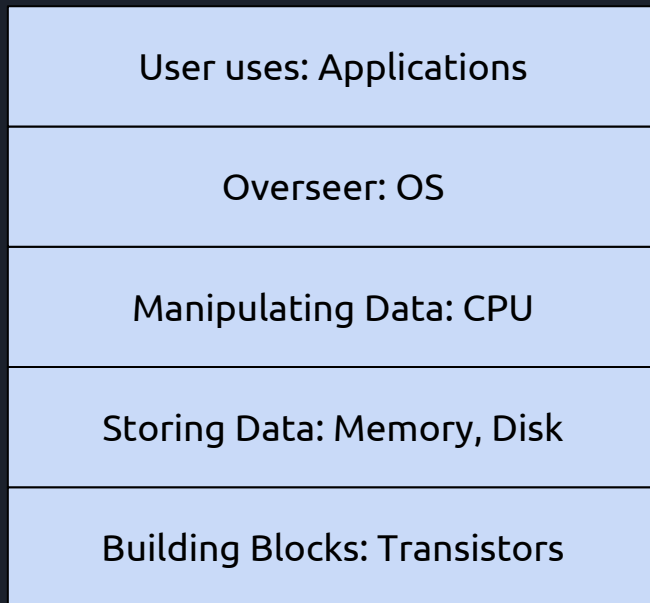

Storing Data: Memory, Disk

**Computers store and manipulate data.**

Networks transfer data.

Computers store and manipulate data.

**Networks transfer data.**

# Networks

So we can store and manipulate data within one computer

# Networks

So we can store and manipulate data within one computer

How do we transfer data between computers?

# Networks

So we can store and manipulate data within one computer

How do we transfer data between computers?

- First let's prepare the data for transmission...

# Protocols

Standardized procedures for communication

Can't just send your raw data into a network

- Where does it go?
- What is the data?
- What if some of the data is lost?
- How do you know it was sent?

# Protocol Stack

# Routers

Routers are devices that forwards data packets

Routing tables make sure we get to the destination IP address

- Another protocol

Physical and wireless transmission

- WiFi uses radio signals (electromagnetic wave modulation)

# Routers

Routers are devices that forwards data packets

Routing tables make sure we get to the destination IP address

- Another protocol

Physical and wireless transmission

- WiFi uses radio signals (electromagnetic wave modulation)

Routers use IP addresses — what's the IP for google.com?

# Domain Name System (DNS)

Converts web URLs into IP addresses

Distributed database that tracks names and IP addresses

# Domain Name System (DNS)

Converts web URLs into IP addresses
